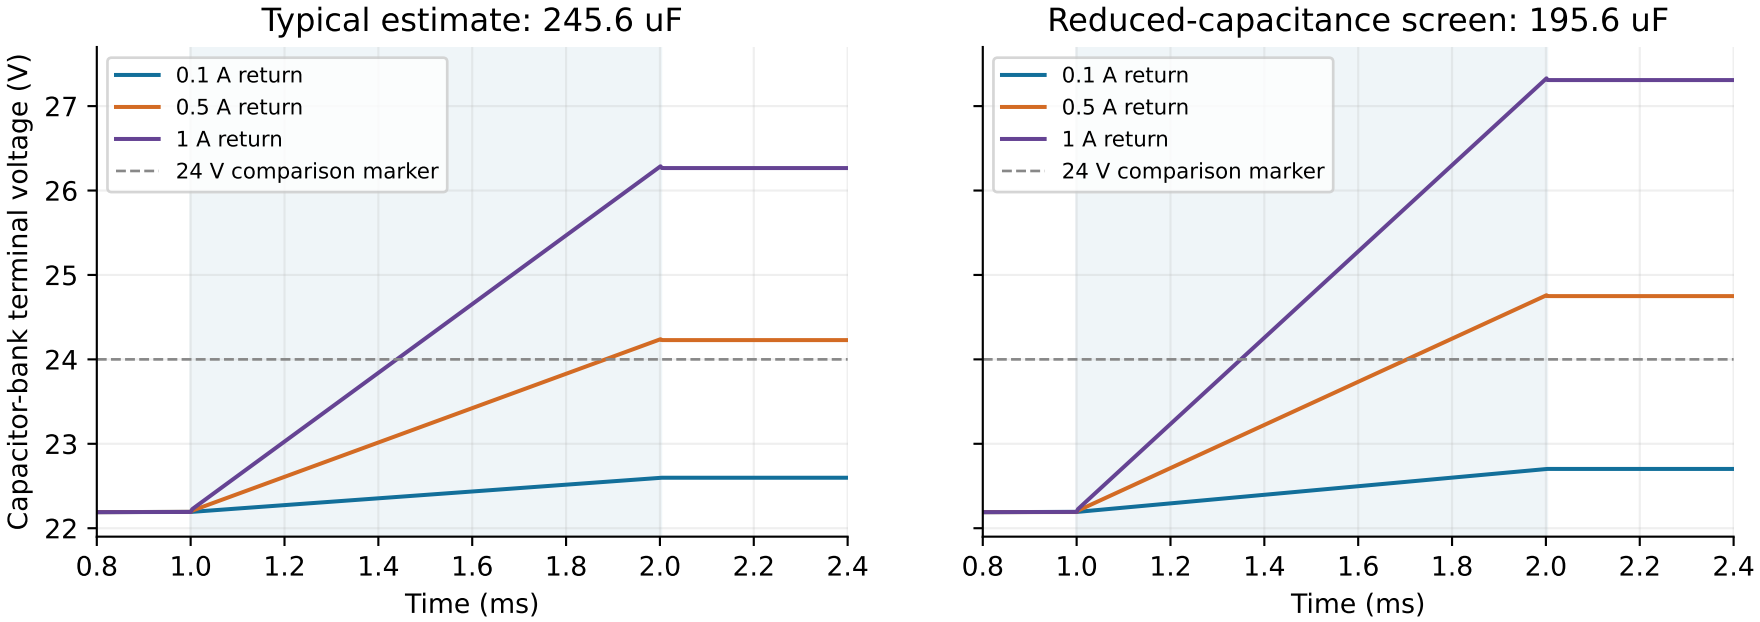
Motor output capacitors under injected current

Isolated capacitor bank only: no converter, load, motor model or reverse-current path



Return pulse: 1 ms flat top, 1 us edges. Bulk series resistance: 30 mohm proxy.
24 V is only a comparison marker, not a verified motor limit. Fixed capacitances approximate DC-bias behavior.
These plots show charge storage under assumed pulses; they do not validate the LMR51450 during regeneration.
